

Transforming Healthcare Insurance Operations: A Data Governance Journey for MOOP Compliance

Artha Solutions partnered with a leading health insurance provider to streamline Maximum Out-of-Pocket (MOOP) tracking and compliance. Using Talend to address critical data integration challenges, Artha enhanced policyholder expense management, ensured accurate claims processing, and automated data ingestion across multiple vendors

Outcomes

45%

Reduction in manual claims processing time, leading to faster approvals.

50%

Improvement in regulatory compliance reporting accuracy.

30%

Decrease in customer disputes related to MOOP tracking.

99.5%

Data Accuracy, ensuring trust and reliability in financial planning.

1K+

Vendors Integrated, creating a scalable and reusable framework for future expansions.

Challenges

Fragmented Data Sources

The insurer managed 1,000+ healthcare vendors, making it difficult to accumulate MOOP data accurately.

Customer Trust and Satisfaction

Members lacked real-time visibility into their MOOP status, resulting in frustration and disputes.

Regulatory Compliance Risks

Manual tracking led to errors in policyholder MOOP calculations, increasing the risk of penalties.

Operational Inefficiencies

Legacy systems and manual claim processing caused delays and inconsistencies.

Solutions Provided

Automation & Centralization of MOOP Data

Integrated 1,000+ vendor data points into a single automated framework, standardizing data validation processes to ensure accuracy and consistency.

Real-Time MOOP Tracking for Members

Enabled members to track their MOOP usage via an online dashboard, improving transparency and reducing disputes and customer service inquiries.

Data Quality & Governance Implementation

Ensured data accuracy by aligning with business rules and established an exception-handling process to capture rejected records and notify the business team.

Regulatory Compliance & Risk Management

Implemented automated compliance checks to reduce regulatory penalties and identified fraudulent claims by analyzing unusual MOOP limit utilization patterns.
