

Think Data, Think Artha.

CASE STUDY

Master Data Management

From Data Chaos to Manufacturing Precision

How a Global Workwear Brand Leveraged MDM to Optimize Its Manufacturing Process

A leading global manufacturer of durable workwear was grappling with fragmented data spread across its ERP, CRM, POS, and third-party sales systems. The lack of a unified view of customer and product data created bottlenecks—not just in customer service but also across the manufacturing floor. Variances in order data, delayed visibility into demand patterns, and inconsistent customer records disrupted planning and production cycles.

Outcomes

50K

Duplicate customer records eliminated in the first six hours—minimizing planning distortions.

65%

Improvement in real-time responsiveness, enabling on-the-fly order modifications across systems.

30%

Increase in revenue, supported by better upsell targeting and more efficient production alignment.

Challenges in the Manufacturing Ecosystem

Inconsistent Demand Signals

Fragmented data led to unclear insights into product demand from retail, e-commerce, and partner platforms like Amazon and Bass Pro.

Order Modification Delays

Absence of real-time data synchronization impacted the ability to reflect last-minute order changes on the production line.

Duplicate Customer Data

Inaccurate customer records made it difficult to forecast repeat orders and optimize batch manufacturing schedules.

Slow Response to Market Trends

Without unified customer intelligence, adjusting production for high-demand SKUs was delayed, leading to lost sales opportunities and overstock issues.

Solutions Provided

Artha Solutions deployed a high-speed, on-premise Talend Master Data Management (MDM) solution in record time—just 3 months. The focus wasn't limited to customer experience—it extended into unlocking operational excellence across the manufacturing value chain.

Golden Record Creation

Standardized and deduplicated customer and product data to create a single source of truth for order and inventory management.

Data Quality Enforcement

Address validation and deduplication ensured that production forecasts were based on clean, accurate data.

Real-Time Data Synchronization

Integrated data flows from SAP ERP, Salesforce CRM, POS systems, and third-party platforms to ensure the manufacturing team received up-to-date order and demand signals.
