

Accelerating AI Adoption with a Quick-Start AI/ML Lab

Short-Term Outcomes (Immediate Value) - These are the direct results at the end of the 6-8 week engagement:

A working prototype demonstrating the feasibility of AI/ML for the customer's data creating a baseline.

Guidelines on AI/ML adoption, model retraining strategies, and governance policies.

A structured plan outlining the next steps for scaling AI/ML within the organization.

A global healthcare distributor struggled to leverage AI/ML for data-driven decisions and inventory optimization. They lacked a roadmap, expertise, and data confidence. Partnering with Artha Solutions, they established a Quick-Start AI/ML Lab. This enabled rapid testing, validation, and scaling of AI-driven forecasting models.

Long-Term Outcomes (Strategic Benefits) - These are the advantages gained as they build on the foundation laid by the Quick Start Lab:

Framework to extend AI/ML models beyond the initial use case to other areas of the business.

AI/ML Skill Development for Internal teams, enabling future innovation.

A competitive edge with AI-powered insights lead to better customer experiences, operational efficiency, and revenue growth.

Outcomes

40%

40% Faster AI Deployment: Quick-Start AI/ML Lab enabled implementation in 6 weeks, accelerating adoption.

25%

AI-driven forecasting increased efficiency by 25%, reducing manual work & improving inventory decisions.

20%

Improved data quality & AI adoption boosted stakeholder confidence by 20%, increasing leadership buy-in.

Challenges

Uncertainty in AI/ML Adoption

The company was eager to explore AI but struggled with where to start, feeling overwhelmed by AI hype and lacking a clear implementation strategy.

Overwhelming Volume of Data

With vast amounts of product, sales, and market data, the company faced analysis paralysis, making it difficult to extract meaningful business insights.

Data Quality & Readiness Concerns

There was a lack of trust in data accuracy and completeness, creating doubts about whether AI-driven insights could be reliable for decision-making.

Initial KPI & Forecasting Limitations

The initial goal was to predict product sales by zip code and month, but insufficient data points made this approach ineffective. A new forecasting strategy was needed.

Solutions Provided

To address these challenges, Artha helped implement a structured AI/ML lab approach, ensuring a fast, effective, and scalable AI adoption process.

Data Assessment & Readiness Validation

Performed data quality checks and validation, identifying gaps in completeness and establishing a data preparation pipeline for reliable AI-driven insights.

Redefined AI Use Case for Forecasting

Shifted KPI to warehouse-level sales forecasts, integrating internal/external data for improved inventory management and forecast accuracy.

AI Model Development & Deployment

Evaluated multiple AI models, selecting H2O.ai Driverless AI for its automation and scalability, building a baseline forecasting model on Azure for seamless deployment.

Scalability & Future AI Expansion

Developed a future-ready AI framework, allowing the company to scale AI adoption across multiple use cases without overhauling existing systems.
