

Digital Transformation Journey with Talend: Accelerating Healthcare Data Integration

A leading global healthcare solutions provider serving over 1 million customers partnered with Artha Solutions to optimize its Talend data integration platform, addressing performance issues and modernizing development practices.

Outcomes

25-30%

Faster job execution and testing processes through optimized memory and streamlined codebase.

10-15%

reduced code redundancy by standardization and reusable components.

90%

Achieved 90% readiness for cloud migration.

15-20%

Projected reduction in operational costs post-migration.

Challenges

Memory and Performance Issues

Talend virtual desktops were under-resourced, with insufficient memory leading to slow development and testing processes.

Code Bloat and Redundancies

Overuse of flow meter components and lack of reusable code structures led to inefficiencies and maintenance challenges.

Lack of Monitoring and Logging

Absence of robust monitoring tools limited visibility into job execution and performance metrics.

Non-Standardized Development Practices

Hard-coded settings and siloed DEV-TEST-PROD environments caused inefficiencies and inconsistencies. operational efficiency.

Solutions Provided

Optimized Memory Allocation

Increased system memory for Talend VDIs and Studio, significantly enhancing performance and responsiveness.

Reusable Code Components

Developed joblets and SQL scripts to streamline workflows, reduce code redundancies, and improve efficiency.

Standardized Workflows

Introduced context variables and metadata for configuration management, enabling seamless job migration across environments.

Advanced Monitoring Tools

Implemented an Activity Monitoring Console (AMC) database and project-level logging to provide real-time visibility into system performance.
