

Data Transformation in Insurance: MDM & Big Data

A leading US financial and insurance company with diverse services faced challenges managing data across its businesses. To address this, they sought to build a robust Enterprise Data Management (EDM) platform incorporating MDM capabilities. This platform would serve as a central data repository, supporting critical business analytics.

Outcomes

30%

Reduced system disruption by 30% with the plug-in architecture.

25%

Increased data accuracy by 25%, enhancing processing efficiency by 20%.

40%

Achieved seamless orchestration using AWS data pipeline, reducing manual intervention by 40%.

40%

Improved collaboration, leading to a 40% increase in data sharing across departments.

Challenges

Service Organization Needs

Establish an EDM platform to serve as a centralized service organization across multiple Lines of business.

Big Data Integration

Introduce Big Data technologies to support the growing demands of the competitive business landscape.

Master Data Management (MDM)

Build a Master Data Management solution to handle the intricacies of producer and consumer data.

Solutions Provided

Cloud-Based Scalable Data Platform

Leveraged Amazon Cloud for scalability, reliability, and global reach while integrating the Talend Big Data platform to enhance data processing efficiency and management.

Optimized Big Data Processing and Integration

Leveraged HDFS clusters for mastering large datasets with scalability and parallel processing, while implementing comprehensive data management processes to extract valuable insights and enable efficient data subscription across departments.

Flexible and Adaptive Enterprise Data Management (EDM)

Designed and deployed an EDM platform with a plug-in architecture for seamless data source integration and adaptability, while implementing AWS Data Pipeline to automate data transfer and workflow orchestration.

Data Standardization and Transformation for Accuracy

Utilized Big Data Pig infrastructure to transform diverse data sources into a standardized canonical format, applying data standardization, transformation, and survivorship rules to enhance data consistency, quality, and generate a single master record.
