

Enterprise Data Governance and Master Data Management (MDM) with Talend

Client Profile:	A Leading Commercial Bank in North America	Industry:	BFSI
Region:	North America	Solution Area:	Master Data Management (MDM) & Data Governance
Technologies:	Talend Data Fabric, Snowflake, AWS S3, Apache Spark	Date:	May 2026

Business Challenge

The client, a major commercial bank with operations spanning retail and commercial lending, struggled with decentralized customer records. Due to legacy acquisitions, customer records were scattered across 12 source systems. This fragmentation resulted in severe data inconsistencies (e.g., duplicated profiles, divergent credit scores), compliance issues with KYC/AML audits, and significant manual reconciliation overhead. Business analysts spent over 40% of their time manually compiling customer summaries for reporting.

Solution Delivered

Artha Solutions designed and deployed an active Data Governance and Master Data Management (MDM) framework using Talend Data Fabric. The solution ingested customer metadata in real-time, matching and merging duplicates into a single golden record in a secure Snowflake data warehouse. Talend Data Stewardship was integrated, allowing business curators to resolve matching exceptions via custom interactive workflows.

Implementation Approach

The implementation followed a three-phase approach: first, mapping metadata properties and establishing survivorship rules; second, deploying Talend pipelines to clean and standardise names, emails, and tax IDs; and third, implementing active data reconciliation triggers that push live updates to downstream systems on AWS S3.

Business Outcomes

The Talend MDM solution successfully established a unified customer directory, eliminating duplicate records across systems. Regulatory audit preparation time was reduced from weeks to a single click. The data repository now serves as a trusted foundation for active intelligence and localized AI analytics.

Key Result Metrics

The implementation delivered quantifiable improvements: achieved a 40% reduction in compliance reporting time, improved active data reconciliation accuracy by 80%, accomplished 95% automated data validation scoring, and successfully consolidated customer data from 12 separate legacy platforms.

Executive Quote

"Artha Solutions transformed our customer data landscape, bringing order to our compliance pipelines and delivering a trusted data repository that underpins our modern banking applications."
